## NTC THERMISTOR-INRUSH CURRENT LIMITING DEVICES

Joyin NTC Thermistor(JNR) devices are made of a specially formulated metal oxide ceramic material which is capable of suppressing high inrush current surges.

JNR devices, being of relatively high resistance, shall limit the inrush current for 1 ~ 2 seconds during which time the device decreased in resistance substantially to a point where its voltage drop is negligible. The devices are especially useful in power supplies (see FigA) because of the extremely low impedance of the capacitor being charged, of which the bridge is usually subjected to an exceedingly high current surge at turn-on point.

## FEATURES

- High inrush current restriction effect.
- Small power loss in stationary state.  
(Normally 1W or less than 50W power.)
- High thermal and electrical stability.
- Wide selection of electrical characteristics.

## APPLICATION

As shown in Fig. B, the current surge can be eliminated by placing a NTC thermistor in series with a filament string. Yet, if the resistance of one NTC thermistor does not provide sufficient inrush current limiting functions for your application, two or more may be used in series or in separate legs of the supply circuit(Fig. A). Be noticed, the thermistor can not be used in parallel since one unit will tend to conduct nearly all the current available. Thus, JNR thermistor may be used in the AC(point A1 or A2) or the DC(point D1 or D2) locations in the circuit.(See Fig. A)

The resistance of NTC thermistor is designed higher than the total resistance of filaments when the circuit is turned on.

As current begins flowing, the thermistor shall immediately "self-heat". Then, in 1 ~ 2 seconds, its resistance will be reduced to a minimum and become insignificant to the total resistance of a circuit. With the same concept, current surges in electric motors can be held to minimum. Fig. C shows a typical DC motor's turn on surge before and after the application of a JNR thermistor to the circuit.

## NTC熱敏電阻-突流限制元件

久尹的NTC熱敏電阻器(定名為JNR)係由特殊配製的金屬氧化物陶瓷材料製成,它可用來抑制高的突波電流。相對於受保護電路,JNR熱敏電阻器具有較高的電阻;因此會抑制突波電流約1~2秒,在這一段時間內JNR的電阻將因溫度升高而下降,直至熱敏電阻兩端壓降到可被忽略的電阻值為止。如圖A以電源供應器為例,在電源開的瞬間,電容器一般阻抗極低,橋式整流器通常承受很大的電流,故JNR熱敏電阻器特別適用於保護電源供應器。

## 特質

- 有效抑制突波電流。
- 穩定狀態下功率損耗極小(通常僅有1W或小於50W)。
- 熱及電特性穩定性高。
- 寬廣的電性規格可供選擇。

## 應用概述

如圖B所示,將一NTC熱敏電阻與一白熱燈絲串聯時,可以消除突波電流。若一只NTC熱敏電阻無法提供足夠之突流限制功能時,二只或更多的熱敏電阻可用於串聯電路上或供應電路的各個分路上(如圖A)。但要注意的是NTC熱敏電阻,不可並聯於電路上,因為其中一只NTC就可能會傳導幾乎所有的電流。JNR熱敏電阻最好用於圖A所示AC電路的A1或A2處,或是DC電路D1或D2處。在設計上,當電路剛被打開的瞬間,NTC熱敏電阻的阻值高於電路上所有白熱燈絲的總電阻值。當電流開始通過時,熱敏電阻隨即產生「自熱」現象,並在1到2秒內,阻值會降到幾可忽略。以同樣的構想來看電動馬達的突波電流,亦可以被抑制到最低限度。圖C表示應用JNR熱敏電阻保護直流馬達前後突波電流波形的差異。

### NTC THERMISTOR CHARACTERISTICS

To choose for application or take as referable parameters, the NTC thermistors are usually decided by the following three fundamental characteristics:

#### Temperature-Resistance Characteristic:

The resistance value of NTC thermistor is decreased while The ambient temperature or itself temperature is increased.

(See Fig.D)

Fig.D

### NTC熱敏電阻之特性

應用上NTC元件的參數,通常由下列三種基本特性決定:

#### 溫度-電阻特性:

當NTC熱敏電阻之環境溫度或它本身的溫度上升時, NTC的電阻值隨之減小(如圖D)。

(如左圖D)

- Nominal resistance at 25°C(Ω)  $R_{25}$
- Zero-power resistance(Ω)  $R_T$
- Tolerance on the resistance nominal  
 $\Delta R_{25}/R_{25}=15\%(L), 20\%(M)$
- Material constant(Sensibility index)(°K)  $\beta$
- Temperature coefficient of resistance(% / °C)  $\alpha_T$

- 25°C時之電阻值(Ω)  $R_{25}$
- 零功率電阻值(Ω)  $R_T$
- 電阻值之容許差  
 $\Delta R_{25}/R_{25}=15\%(L), 20\%(M)$
- 材料常數(敏感度指數)(°K)  $\beta$
- 電阻溫度係數(% / °C)  $\alpha_T$

**Voltage-Current Characteristic:**

When operating in small current (see fig.E), due to very low power is unable to make the NTC thermistor self-heated, so its resistance value is thus maintained constant and displayed with a linear curve (in conformity with ohm-law  $V/R=I$ ). if the current is increased, the NTC thermistor will follow Joule-efficiency( $P=V \times I$ ) and make itself self-heated that results in a resistance value decreasing and thus displays with a status of "voltage descending while current increased."

(如左圖E)

- Thermal dissipation coefficient( $mW/^{\circ}C$ )  $\delta$
- Maximum steady-state current(A)  $I_{max}$ .
- Resistance at maximum current( $\Omega$ )  $R_{I_{max}}$ .

**電壓-電流特性:**

當NTC熱敏電阻在小電流下工作時(如圖E),由於功率太低,其電阻值保持固定而表現線性關係(符合歐姆定律 $V/R=I$ )。如果電流增加,NTC熱敏電阻就會產生焦耳效應( $P=V \times I$ )而使自己發熱,其電阻值隨即減小表現「電流增加,電壓下降」的狀態。

- 熱散逸係數( $mW/^{\circ}C$ )  $\delta$
- 最大穩定電流(A)  $I_{max}$ .
- 最大電流時之電阻( $\Omega$ )  $R_{I_{max}}$ .

**Temperature-Time Characteristic:**

As shown in Fig. F which explains the time needed to reach the thermal equilibrium of NTC components with the environment. This characteristic depends on two important parameters. If a step change in temperature is applied to a component e.g. from high( $T_1$ ) to low( $T_0$ ) temperature, the energy lost ( $\delta (T-T_0)dt$ ) by the component( $-HdT$ )is equal to the energy dissipated by it.  $-HdT = \delta (T-T_0)dt$   
This equation yields:  $T-T_1 = (T_0-T_1) \times e^{-t/\tau}$ ,  $\tau = H/\delta$

**溫度-時間特性:**

(如圖F),說明NTC元件與環境達成熱平衡所需的時間,主要決定於材料熱容量(H)及散熱係數( $\delta$ )。當元件溫度由 $T_1$ 降到 $T_0$ ,則可得到下列平衡式:  
 $-HdT = \delta (T-T_0)dt$  其中  $-HdT$ =元件熱損失  
 $\delta (T-T_0)dt$ :元件散熱量  
積分後可得溫度與時間關係式 $T-T_1 = (T_0-T_1) \times e^{-t/\tau}$   
其中  $\tau = H/\delta$

(如左圖F)

### Inrush current

Inrush current is the initial surge of current that results when power is firstly applied to a load having a low starting impedance, such as a discharged capacitor, a cold lamp filament, or a stopped motor, etc.

### Inrush current limiter

Specially designed and constructed NTC thermistor may be used as an inrush current limiter. JOYIN inrush current limiter(JNR) is available in a wide range of current handling and zero-power resistance value combinations.

### Zero-power resistance( $R_0$ )

The zero-power resistance is the direct current resistance value of a thermistor measured at a specified temperature "T" with a power dissipation by the thermistor low enough that any further decrease in power will result in less than 0.1 percent change in resistance.

### Maximum steady-state current( $I_{max}$ .)

The maximum steady-state current is the rating of the maximum current, normally expressed in amperes(A), allowable to be conducted by an inrush limiting NTC thermistor for an extended period of time.

### Resistance at maximum current( $R_{I_{max}}$ .)

The resistance at maximum current is the approximate resistance of an inrush current limiting thermistor, expressed in ohms( $\Omega$ ), when it is conducting its rated maximum Steady-state current.

## 參數定義

**Thermal dissipation coefficient( $\delta$ )**

The thermal dissipation coefficient is the ratio, normally expressed in milliwatts per degree C(mW/°C), at a specified ambient temperature, of a change in power dissipation in a thermistor to the resultant body temperature change. ( $\delta = V \times I / \Delta T$ )

**Thermal time Constant ( $\tau$ )**

The thermal time constant is the time required for a thermistor to change 63.2 percent of total difference between its initial and final body temperature when subjected to a step function change in ambient temperature under zero-power condition and is normally expressed in second.

**Material constant( $\beta$ )**

The material constant of a NTC thermistor is a measure of its resistance at one temperature compared to its resistance at a different temperature. Its value may be calculated by the formula shown below and is expressed in degrees kelvin (°K). The reference temperature used in this formula for determining material constant rating of JOYIN thermistor is 298.15°K and 323.15°K  $\beta = \text{Ln}(R_1/R_2) / (\frac{1}{T_1} - \frac{1}{T_2})$

**Temperature coefficient of resistance( $\alpha_T$ )**

The temperature coefficient of resistance is the ratio at a specified temperature T, of the rate of change of zero-power resistance with temperature to the zero-power resistance of the thermistor. The temperature coefficient is commonly expressed in percent per degree C(%/°C).  $\alpha = 1/R \text{ dR/dT}$

**Surge energy:**

Surge energy is the maximum energy of pulses. The thermistor is capable of tolerating surge energy more than 1000 times with the resistance changing rate within  $\pm 10\%$ . This energy varies with voltage and capacitance.
