

General Purpose Chip Resistors (1Ω~10MΩ)

Feature

1. High reliability and stability
2. Reduced size of final equipment
3. Lower assembly costs
4. Higher component and equipment reliability
5. RoHs compliant and lead free products

Application

1. Consumer electrical equipment, PDA digital Camcorder.
2. EDP, Computer application
3. Mobile phone ,Telecom
4. Power supply , Battery charger ,DC-DC power converter
5. Digital meter
6. Automotive.

Description

The resistors are constructed in a high grade ceramic body(aluminum oxide). Internal metal electrodes are added at each end and connected by a resistive paste that is applied to the top surface of the substrate. The composition of the paste is adjusted to give the approximate resistance required and the value is trimmed to within tolerance by laser cutting of this resistive layer.

The resistive layer is covered with a protective coat. Finally, the two external and terminations are added. For ease of soldering the outer layer of these end terminations is a Lead-tin or Tin solder alloy.

Remark :

- 1 . Detailed resistance vs. TCR and ordering code please refer to specific specifications.
- 2 . Jumper resistor is not designed for fusing applications, designers shall apply dedicate fusible resistor or standard fuse in application circuits.
- 3 . WRxxW defines for ±1% < 10ohm or > 1Mohm.

Function For Low Ohm Chip Resistors

The low ohmic resistors are used to sense output current in power supply, automotive and engine control management system, and other power sensing application. As shows in figure below, the typical function of low ohmic (power) chip resistor is to be a current sensor (R_{sense}) to generate the sensing voltage (V_s) for the purpose of feedback control when output current (I_o) passed on it . The sensing voltage be treated as a signal to trigger the switches (CMOS) ON/OFF duration so that to monitor and/or adjust the output current from inductor.

Simplify to say, $V_s = I_o \times R_{sense}$.

In general case, this feedback voltage is setting around 100mV for considering both on power saving and noise robustness. To sense a 5 ampere average output current, the R_{sense} resistance value therefore be required as $100mV / 5A = 20 m\Omega$, the power dissipation will be :

$$P = I^2 \times R = 5A^2 \times 20m\Omega = 0.5Watt$$

A low ohmic chip resistor with a power rating of 1.0 watt is recommended on this application in case the power safety margin is taken into account.
