

NE555

LINEAR INTEGRATED CIRCUIT

SINGLE TIMER

DESCRIPTION

The UTC **NE555** is a highly stable timer integrated circuit. It can be operated in both Astable and Monostable mode. With monostable operation, the time delay is precisely controlled by one external and one capacitor. With a stable operation as an oscillator the frequency and duty cycle are both accurately controlled with two external resistors and one capacitor.

FEATURES

- * High current driver capability (=200mA).
- * Adjustable duty cycle.
- * Timing from μs to hours.
- * Turn off time less than $2\mu\text{s}$.
- * Operates in both astable and monostable modes.

■ TYPICAL APPLICATION CIRCUIT

■ TYPICAL APPLICATION NOTES

The application circuit shows astable mode configuration.

Pin 6 (Threshold) is tied to Pin 2 (Trigger) and Pin 4 (reset) is tied to V_{CC} (Pin 8). The external capacitor C1 of Pin 6 and Pin 2 charges through R_A , R_B and discharges through R_B only. In the internal circuit of UTC **NE555N** , one input of the upper comparator is at voltage of $2/3V_{CC}$ ($R_1=R_2=R_3$), another input is connected to Pin 6. As soon as C1 is charging to higher than $2/3V_{CC}$, transistor Q1 is turned ON and discharge C1 to collector voltage of transistor Q1. Therefore, the flip-flop circuit is reset and output is low. One input of lower comparator is at voltage of $1/3V_{CC}$, discharge transistor Q1 turn off and C1 charges through R_A and R_B . Therefore, the flip-flop circuit is set output high.

That is, when C1 charges through R_A and R_B , output is high and when C1 discharge through R_B , output is low. The charge time (output is high) t_1 is $0.693(R_A+R_B) C_1$ and the discharge time (output is low) T_2 is $0.693 R_B \times C_1$.

$$\ln \frac{V_{CC} - \frac{1}{3} V_{CC}}{V_{CC} - \frac{2}{3} V_{CC}} = 0.693$$

$$T_1 = 0.693 \times (R_A + R_B) \times C_1$$

Thus the total period time T is given by

$$T_2 = 0.693 \times R_B \times C_1$$

$$T = T_1 + T_2 = 0.693(R_A + 2R_B) \times C_1.$$

Then the frequency of astable mode is given by

$$f = \frac{1}{T} = \frac{1.44}{(R_A + 2R_B) \times C_1}$$

The duty cycle is given by

$$\text{D.C.} = \frac{T_2}{T} = \frac{R_B}{R_A + 2R_B}$$
